

OXFORD CAMBRIDGE AND RSA EXAMINATIONS

Friday 24 June 2022 – Morning

A Level Computer Science

H446/02 Algorithms and programming

**Time allowed: 2 hours 30 minutes
plus your additional time allowance**

YOU CAN USE:

**a ruler (cm/mm)
an HB pencil**

DO NOT USE:

a calculator

Please write clearly in black ink.

Centre number

--	--	--	--	--

Candidate number

--	--	--	--

First name(s) _____

Last name _____

READ INSTRUCTIONS OVERLEAF

INSTRUCTIONS

Use black ink. You can use an HB pencil, but only for graphs and diagrams.

Write your answer to each question in the space provided. If you need extra space use the lined pages at the end of this booklet. The question numbers must be clearly shown.

Answer ALL the questions.

INFORMATION

The total mark for this paper is 140.

The marks for each question are shown in brackets [].

Quality of extended response will be assessed in questions marked with an asterisk (*).

ADVICE

Read each question carefully before you start your answer.

BLANK PAGE

SECTION A

Answer ALL the questions.

- 1 A computer program stores data in an array named words.
- (a) The data in the array needs to be searched for a value that the user inputs.
- (i) One example of a searching algorithm is a binary search.

Identify the precondition for a binary search.

[1]

- (ii) A second example of a searching algorithm is a linear search.

Describe how a linear search works.

[4]

(b) The array `words` is defined as a global variable and contains these values:

"house"	"boat"	"car"	"telephone"	"garden"	"spice"	"elephant"
---------	--------	-------	-------------	----------	---------	------------

The pseudocode function `useWords()` here uses the global array `words`.

The number of words in the array `words` is passed as a parameter.

```
function useWords(numberOfWords : byVal)
```

```
    contents = ""
```

```
    for count = 0 to numberOfWords - 1
```

```
        contents = contents + words[count] + " "
```

```
    next count
```

```
    return contents
```

```
endfunction
```

(i) Identify TWO variables in the function `useWords()`.

1 _____

2 _____ [2]

(ii) `numberOfWords` is a parameter passed by value.

Describe the difference between passing a parameter by value and by reference.

_____ [2]

- (iii) Rewrite the function `useWords()` to use a while loop instead of a for loop.

The function header and close have been written for you.

Write your answer using pseudocode or program code.

```
function useWords(numberOfWords :  
byVal)
```

```
endfunction [4]
```

- (c) Give ONE benefit and ONE drawback of declaring the array as a global variable instead of a local variable.

Benefit _____

Drawback _____

[2]

- (d) Describe ONE feature of an Integrated Development Environment (IDE) that can be used to help write the program AND ONE feature that can be used to help test the program.

Write _____

Test _____

[4]

(e) Functions and procedures are reusable components.

Give TWO benefits of writing a program with reusable components.

1 _____

2 _____

[2]

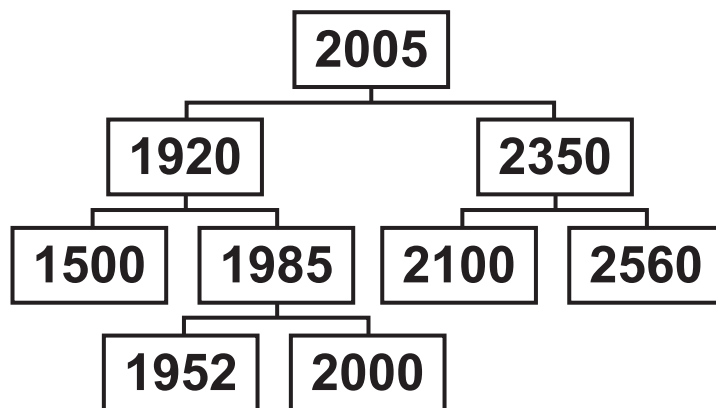

BLANK PAGE

- 2 A computer program is being written to store data about students.

FIG. 2 shows a binary search tree that stores data about students.

Each student is represented by their ID number. The current contents of the binary search tree are:

FIG. 2

- (a) Identify the root node in the binary tree shown in FIG. 2.

_____ [1]

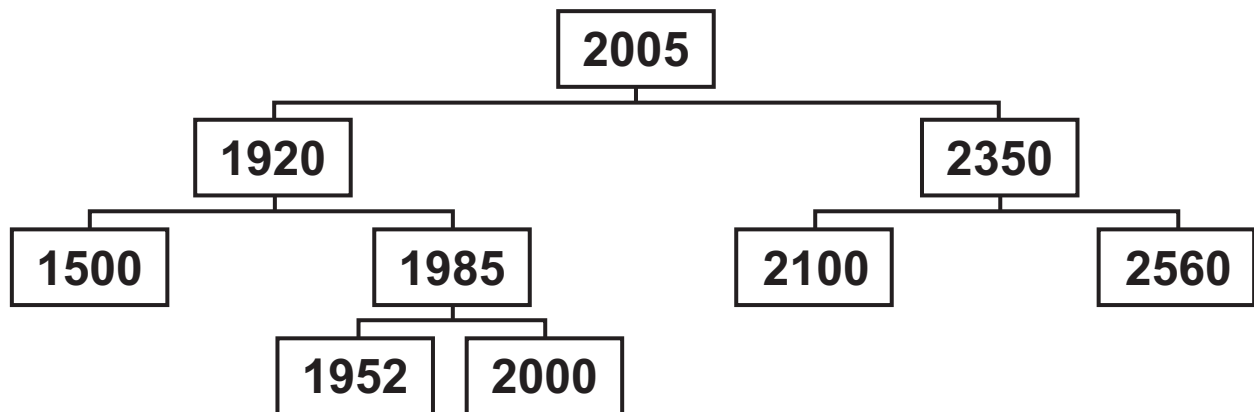

- (b) Identify TWO leaf nodes in the binary tree shown in FIG. 2.

1 _____
2 _____ [2]

(c) Four more students are added to the binary search tree shown in FIG. 2 in this order:

1420 2050 2780 2600

Complete the binary search tree here by adding the new students to it. [4]

(d)* A programmer would like to traverse the binary search tree shown in FIG. 2.

Compare the use of a breadth-first traversal and a depth-first (post-order) traversal on the binary search tree.

You should include the following in your answer:

**how each traversal works
the order of the return values for each
traversal. [9]**

[illegible]

3 A bubble sort will sort an array of 50 integer values called `numberArray`.

(a) State why the integer values are stored in an array instead of separate variables.

[1]

(b) This bubble sort algorithm is written to sort `numberArray` into ascending numerical order.

Complete this bubble sort algorithm. [5]

```
arrayLength = _____
```

```
tempValue = 0
```

```
do
```

```
    flag = false
```

```
    for y = 0 to arrayLength - _____
```

```
        if numberArray[y] > numberArray[y + 1] then
```

```
            _____ = numberArray[y]
```

```
            numberArray[_____] = numberArray[y + 1]
```

```
            numberArray[y + 1] = _____
```

```
flag = true  
endif  
next y  
until flag == false
```

(c) One section of `numberArray` is shown here.

2	12	1	9	3	5	15	7
---	----	---	---	---	---	----	---

A second sorting algorithm that could be used to sort this data is a merge sort.

Show how a merge sort will sort this section of the array `numberArray` into ascending numerical order.

[4]

(d)* Another sorting algorithm is insertion sort.

**The number of values stored in the array
numberArray has been reduced to 10.**

**Compare the use of bubble, merge and insertion
sorts on the array numberArray.**

You should include the following in your answer:

**how each algorithm works
the Big O complexities for each algorithm
the suitability of each algorithm for sorting the
10 values. [12]**

[illegible]

[illegible]

4 A programmer is developing an aeroplane simulator. The user will sit in a cockpit and the simulated environment will be displayed on screens around them.

(a) The programmer uses computational methods to design a solution for the program.

(i) Complete the table by writing a definition for each computational method. [2]

Computational Method	Definition
Abstraction	
Decomposition	

(ii) Give THREE potential differences between the abstracted aeroplane simulator and reality.

1 _____

2 _____

3 _____

[3]

(iii) Identify TWO reasons why abstraction is used when designing a solution to the problem.

1 _____

2 _____

[2]

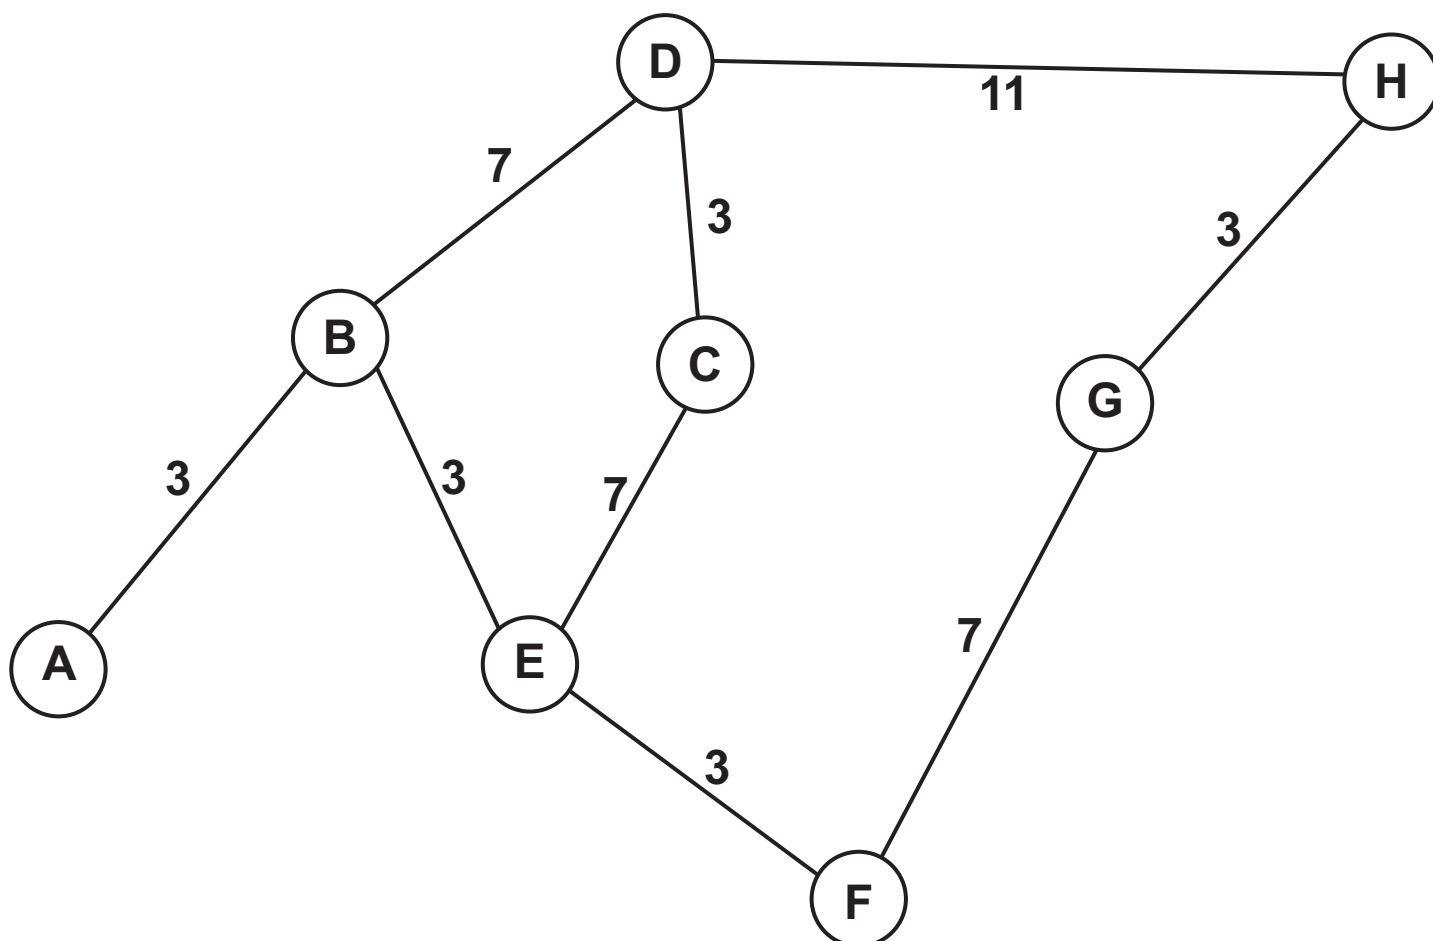

(b) Describe how caching can be used in the aeroplane simulator.

[2]

BLANK PAGE

- 5 FIG. 5 shows a graph data structure representing a small section of a parcel delivery network. Each node represents an address where deliveries need to be made. The edges show the possible routes and distances between these deliveries.

FIG. 5

- (a) (i) State ONE way a directed graph is different to an undirected graph.

[1]

(ii) State ONE way a graph data structure is different to a tree data structure.

[1]

(b) Give ONE reason why the graph is a visualisation of the problem.

[1]

- (c) (i) Show how Dijkstra's algorithm can be used on the graph shown in FIG. 5 to find the shortest path from the start node A and the end node H.

You should state the nodes on the final path and the overall distance. Show your working.

You may choose to use the table below to give your answer. [6]

Node	Distance travelled	Previous node

Final path: _____

Distance: _____

- (ii) Give a similarity and difference between the performance of Dijkstra's algorithm and the performance of A* algorithm.

Similarity _____

Difference _____

[2]

(d) (i) State why performance modelling is used to test a system.

[1]

(ii) Describe how performance modelling can be used in the delivery system.

[2]

BLANK PAGE

- 6 A card game uses a set of 52 standard playing cards. There are four suits; hearts, diamonds, clubs and spades. Each suit has a card with a number from; 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13.**

The card game randomly gives 2 players 7 cards each. The unallocated cards become known as the deck.

The players then take it in turns to turn over a card. A valid move is a card of the same suit or the same number as the last card played.

The winner is the first player to play all of their cards.

- (a) One component of the game is checking if a move is valid.**

Identify THREE other components of the game.

1 _____

2 _____

3 _____

[3]

- (b) A function, `checkValid()`, takes the card the player has selected, and the last card played as parameters.

It returns `true` if the player's move is valid and returns `false` if the player's move is not valid.

- (i) State the reason why `checkValid()` is a function and not a procedure.

[1]

- (ii) The programmer will use a branching (selection) construct to make decisions.

Describe the decisions that will be made in the `checkValid()` function and how these change the return values.

[3]

- (c) The cards are held in the 2D array `cards`. The first index stores the card number and the second index stores the suit, both as strings.

Write a pseudocode statement or program code to declare the array `cards`.

[2]

BLANK PAGE

7 A program uses the recursive function `calculate()`. The function is written in pseudocode.

```
1. function calculate(number : byVal)
2.   if number == 1 then
3.     return number
4.   else
5.     return number + calculate (number - 1)
6.   endif
7. endfunction
```

- (a) (i) Give the line number in the algorithm `calculate()` where a recursive call is made.

_____ [1]

- (ii) State TWO features of any recursive algorithm.

Feature 1 _____

Feature 2 _____

_____ [2]

- (b) Trace the recursive function `calculate()` and give the final return value, when the following function call is run:

`calculate(5)`

You may choose to use the table below to give your answer. [5]

Function call	number	return
calculate (5)		

(c) Give the pseudocode function call that would return 55 from the recursive function `calculate()`.

_____ [1]

SECTION B

Answer ALL the questions.

8 A computer uses a stack data structure, implemented using an array, to store numbers entered by the user.

The array is zero based and has 100 locations.

(a) FIG. 8 shows the current contents of the stack and the first 9 locations of the array.

FIG. 8

		Index	Data
		8	
		7	
pointerValue	5	6	
		5	
		4	1
		3	23
		2	6
		1	5
		0	10

- (i) The function `pop ()` removes an item from the stack.

The function `push ()` adds an item to the stack that is passed in as a parameter.

Show the contents of the stack and pointer from FIG. 8 after the following subroutines calls have run. [2]

`pop ()`

`pop ()`

`push (3)`

`push (6)`

`push (7)`

<code>pointerValue</code>	
---------------------------	--

Index Data

8	
7	
6	
5	
4	
3	
2	
1	
0	

(ii) State the purpose of `pointerValue`.

[1]

(b) The stack is programmed as an object using object-oriented programming. The design for the class, its attributes and methods are shown:

<code>class: stack</code>
<code>attributes:</code> <code>private stackArray : Array of integer</code> <code>private pointerValue : integer</code>
<code>methods:</code> <code>new()</code> <code>function pop()</code> <code>function push(value)</code>

BLANK PAGE

(i) The method `pop()` returns the next value in the stack, or `-1` if the stack is empty.

Complete the pseudocode method `pop()`. [5]

```
public function pop()  
    if pointerValue == _____ then  
        return _____  
    else  
        pointerValue = pointerValue _____  
        returnValue = stackArray[_____]  
        return _____  
    endif  
endfunction
```

- (iii) The main program initialises a new object of type `stack` with the identifier `mathsStack`.

Write pseudocode or program code to declare the object.

[2]

(iv) The main program needs to:

take numbers as input from the user
push them onto the stack `mathsStack` until the stack is full
output an appropriate message if the stack is full.

Complete the pseudocode algorithm to meet these requirements. [4]

```
returnValue = true  
  
while returnValue == _____  
  
    returnValue = mathsStack. _____  
    (input ("Enter Number" ) )  
  
    if returnValue == _____ then  
        _____ ("Stack full")  
  
    endif  
  
endwhile
```

(v) The main program also needs to:

remove one item from the stack at a time and add this to a total

output the total every time an item is removed

stop removing items when either the stack is empty, or 20 items have been removed.

Write pseudocode or program code to meet these requirements. [8]

[illegible]

(c) The program is amended to include the use of several queue data structures.

(i) Describe how an array can be used to implement a queue data structure.

[3]

- (ii)* Discuss the use of object-oriented programming and procedural programming to create and manipulate the queue data structures.

You should include the following in your answer:

the features of object-oriented programming
the features of procedural programming
the benefits of using object-oriented instead of procedural programming when creating several queue structures. [9]

[illegible]

[illegible]

END OF QUESTION PAPER

ADDITIONAL ANSWER SPACE

If additional space is required, you should use the following lined page(s). The question number(s) must be clearly shown in the margin(s).

[illegible]
